Book Descriptions:

Bxcel pc100 manual

The board is a PC100 Bxcel mATX board and was found with a P2 350 and Quantum Bigfoot TS IDE drive. No idea if any of it works or where to start troubleshooting since the board did not include any ram. Any help or advice would be appreciated. Wors of warning it is a noisy beast. If you get a beep code then thats a good sign that the board and CPU are probably working. If you dont, then its in doubt. If this doesnt work then try reseating the CPU. Slot1 is a little flaky sometimes. If you have a multimeter and feel comfortable using it then check voltages. Im not sure but I think that board uses an early VIA chipset, which might be troublesome in some environments but for DOS I dont think it matters. Cant even remember if I tried to make it POST, but when reading about it I read quite a lot about people having trouble getting it to run stably. So if you decide to go ahead and set it up, take it slow and modestly single RAM stick, maybe a PCI graphics card, known good PSU, you probably know the drill . My retro rigs old topic Interesting Vogons threads links to Vogonswiki Report spammers here! Thats a very servicable CMedia chip, so should be fine. This board is one of such examples. Ive never seen an Intel chipset board, but Ive seen a few Socket 370 AT boards so that makes them a little more common in my case actually. Do you know any other AT Slot 1 mainboards. Im genuinely interested. But yeah, I too would be a little disinterested in 440EX and 440LX chipsets because they cant do more than 66MHz FSB. I wonder if you could use any of the later Mendocino or even early Coppermine Celerons with slotket adaptors on these, could be interesting. It had all the usual PC Chips qualities, but nonetheless sold well because it was cheap and usually did the job more or less. That M748LMRT looks insane, expansion ports take such a massive hit That M748LMRT looks insane, expansion ports take such a massive hit Plus it already has crappy VGA, LAN, modem and sound onboard.<http://gonganmi.com/userfiles/dell-projector-manual.xml>

Self Diagnosis

Mini Digital Handycam

EXTRA LITHIUM M

CH **Compact Memory**

MEMORY STICK

Video camera recorder

System

Video recording system
2 rotary heads

Picture recording system
Rotary heads, PCM system

Audio recording system
Quadraphonic 12 bit D/A 20 MHz, 48 kHz, stereo

Video signal
PAL, NTSC, color, EIA standards

Mini DV
PAL outdoor, CCIR standards

Double cassette
Mini DV cassette with the "DV" mark

Mini DV
Tape speed
SP: Approx. 18.81 mm/s
LP: Approx. 12.56 mm/s

Recording/rewind time (using cassette DVN60)
SP: 1 hour
LP: 1.5 hours

Fastforward/rewind time (using cassette DVN60)
Approx. 1 min. and 50 seconds (using the AF sensor adaptor)
Approx. 2 min. and 30 seconds (using the battery pack)

Viewfinder
Electric viewfinder (outdoor)
Image device
1.4 inch CCD (Charge Coupled Device)

Approx. 1,070,000 pixels
Effective Moving image
Approx. 600/600 pixels Still
Image: Approx. 1,000/600 pixels

Lens
Carl Zeiss
Combined power zoom lens
Filter diameter 37 mm (1 1/2 in.)
F1.8 (F1.8) - 1:8 (F1.8) / 1:8 (F1.8)

Focal length
4.2 - 42 mm (1 1/4 - 1 11/16 in.)
14 - 19 mm

Camera mode
48 - 480 mm (1 1/2 - 19 in.)

Memory mode
40 - 400 mm (1 1/2 - 15 3/4 in.)

Color temperature
Auto, 5600K (Daylight), 3200K (Indoor)

Minimum illumination
7 lux (0.18)
0 lux (in the NightShot mode)*
* Objects unable to be seen due to the dark can be shot with outdoor lighting.

Input/Output connectors

5 video input/output
Input/output auto switch
4-pin mini DIN
1.5 ohms, unbalanced
Chrominance signal
0.7 Vp-p (V1.0) - 0.286 Vp-p (V1.0)

Audio/video input/output
Input/output auto switch
AV MINIJACK, 1 Vp-p, 75 ohms, unbalanced, sync negative
302 mV (at output impedance more than 47 kilohms)
Output impedance with less than 2.2 kilohms (Stereo minijack (4-pin))
Input impedance more than 47 kilohms

5 DV input/output
4-pin connector
Headphones jack
Stereo minijack (4.5 mm)
LANC control jack
Stereo minijack (4.5 mm)

MIC jack
Minijack, 6.388 mV low impedance with 2.5 to 3.0 V DC, output impedance 4.5 kilohms (4.5 mm)

Same type

LCD screen

Picture
2.5 inches measured diagonally
50 x 37 mm (2 x 1 1/2 in.)

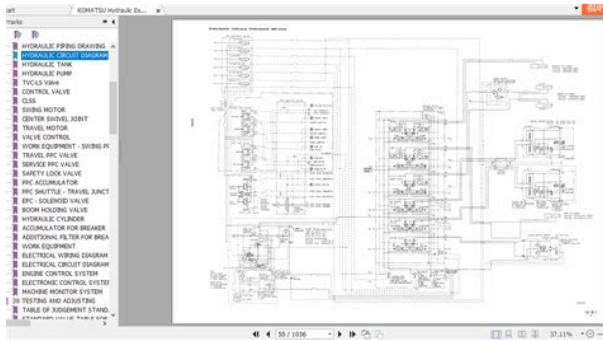

Total dot number
200,640 (580 x 220)

Power requirements
2.2 V (battery pack)
8.4 V (AC power adaptor)

Mini DV **Digital Video Cassette**

SONY

I bought one of these for the equivalent of EUR 37.50 new. It was crap, but it tided me over till I could sell one of the surplus CPUs and save enough to buy something decent I went for a CUBX. But yeah, I too would be a little disinterested in 440EX and 440LX chipsets because they cant do more than 66MHz FSB. I wonder if you could use any of the later Mendocino or even early Coppermine Celerons with slotket adaptors on these, could be interesting. Ive tried it with Mendocinos but it didnt work it freezes during POST at the part where its trying to tell you the name of the CPU. I wasnt able to find any BIOS update online. It doesnt help that the manufacturer went out of business forever ago, and its not from a well known enthusiast brand so theres very little info or support for it on the internet. One I remember looking at closely was an AT version of the Asus P2B. The reason I wanted BabyAT was to minimize the upgrade cost. The Slot1 platform was so expensive that it defeated the purpose. Super 7 made more sense for someone trying to save money, and I guess other people felt the same way given the rarity of slot1 AT boards. Super 7 AT boards are a lot more common. But the cost of the Intel CPU remains, so it was still more expensive than building a super 7 machine. That one and similar motherboards were covered in this topic earlier PC100 M747 The bane of my existence Will it really function with the 133MHz FSB with an appropriate processor. How is it for stability. Im eyeing one of these on Ebay seeing as how there arent any M598s for anything resembling a decent price. Why did I toss mine. Login to post Also, look at the corners to determine how to rotate the chip to fit in the socket. AMD uses triangles to mark the matching corner. Intel chips are too slow for me. An Xeon CPU is junk compared to a Phenom II. It is designed to be paired with a second support chip known as a southbridge. <http://adamhu.com/javier/dell-ps-series-group-administration-manual.xml>

The northbridge has historically been one of the two chips in the core logic chipset on a PC motherboard, the other being the southbridge. Increasingly these functions have migrated to the CPU chip itself, beginning with memory and graphics controllers. God bless you You are just after the Manual. If not; leftclick once in the small empty circle, to the left of Save File. Now go below in the small window, and click on OK. A small download window will come up. Allow the file to download all the way, then DOUBLEclick right on the file name. Another small window will come up. Go to the far left, and click on Extract all files At the bottom of the next 3 small windows, click on Next, Next, and Finish. Motherboard Layout is on Page 16 Internal Connectors on Page 124 Specs on Page 113 for Ram Memory, and Page 11 for the motherboard. A CPU Supports Intel; Core2 Duo, Core2 Quad, and Core2 Extreme processors; with, either an 800MegaHertz Front Side Bus, 1066MHz FSB, or 1333MHz FSB. Ram Memory typically operates at half of the Frequency Rate Speed, of the Processors Front Side Bus. FSB Since the Intel G43 came out in 2008, it stands to reason that the PCI Express technology is PCI Express 2.0 For additional questions please post in a Comment. Regards, joecoolvetteBelieved to be a more accurate method of stating the FSB, than MHz. Was named after a man with the last name Hertz. Scroll down for photos. CPU support can be attested to looking at the specs for the motherboard chipset, on your motherboard. The motherboard chipset is an Intel 865PE chipset. Intel 82865PE northbridge chip, and an Intel ICH5 southbridge chip. Scroll down to 865PE in the left column. The part number on the Intel ICH5 southbridge chip, is Intel 82801EB, The Northbridge chip of the motherboard chipset, handles the Faster capabilities of a computer. Processor CPU, Ram Memory, and HIGHspeed graphics. HIGHspeed graphics is the AGP technology, or PCI Express technology.

If this is a question of what CPU is on your motherboard at present, and the motherboard is in a working computer, suggest use the free tiny program CPUZ from CPUID.com, Need to know how to download, install, and use CPUZ, post back in a Comment. Regards, joecoolvetteThe cache for a Processor is a small memory area for the Processor. It is the First memory the Processor accesses. The Ram Memory is second, and the Harddrive is third. More cache for a Processor makes it more faster The motherboard chipset is an Intel 810. The Northbridge chip of the motherboard chipset, is an Intel 82810. Clean the bottom of the Heatsink THOROUGHLY, and the top of the Processor if it needs it. I always do anyway PROPERLY apply fresh, new Thermal Paste. For additional questions please post in a Comment. Regards, joecoolvetteI have use this app for years and I've just recently had this issue I cannot open it at all Answer questions, earn points and help others. Builtin Hardware Monitor circuit supports thermal, Power and Fan speed monitor; supports Intel LANDesk Client Manager LDCMoptional. Bundled AMI Desktop Client Manager for detecting abnormal condition and thermal automatically or management through the network link. Supports both Slot 1 an Socket 370 Processors for flexible CPU selection. Supports PC99 Color Connector for easy identification of peripheral devices. Provides ATX Form card for USB, PS2 Mouse and fast IR interface optional. Melo by to pomalejsi vykon, ale i tak ten procesor by na tom fakat mel ne Guys Ive got a clients PC where somebody ripped out all the connection jumpers and he wants his PC working again. BLA BLA BLA, guess you all know the story. Could anyone please if you have archives please let me know where I can find a Mobo manual for a BXcel HT1543. Ive searched the web with no luck. Please help!!! PC Chips like Soltech is no more so there is very little information available. However unlike Soltech they where not a good MBoard if they worked for a year they tended to continue working but many failed to work for even a year reliably. These where a Basic Cheepie MBoard that used common Chip Sets. You may have some joy by looking for similar Chip Set MBoards from the Bigger MBoard makers as the PC Chips MBoards where nothing special. They did however have fairly decent Screen Printing on the Boards so it may be possible to replace the Jumpers just by reading the MBoard as it may tell what should go where. Failing that post back with the CPU Type and the MBoard Chip Set and Ill see what I can come up with. Unless Im just reading this wrong and you are asking how to replace the Front Panel Connections to the MBoard. The LEDs are Polarized components so they need to go on to the colored lead to the Positive Connector which is always the Number 1 Connection. The Power LED has a 3 Pin Connector but only uses the two outer pins, The Speaker uses a 4 Pin Connector and again should only use the two outer connections the remaining ones are all a 2 way connector. Col If you think that any of the posts that have been made by all TR Members, have solved or contributed to solving the problem, please Mark them as Helpful so that others may benefit from the outcome. Also please exercise your best judgment when posting in the forums revealing personal information such as your email address, telephone number, and address is not recommended.
